Assignment Requirements:

1. The website must be responsive. In the root of the assignment zip file, you will find the design of the website in both the desktop and mobile view.
2. You will find all images needed in the Assets directory in the assignment zip file
3. The site's background is a long horizontal background that should scroll left and right depending on the user's location vertically through the website. The design file will give you an idea of where the background image's position should be based on the vertical location. This is just used as a rough guideline. We are especially interested in your solution for implementing this in a responsive design.
4. When the user clicks on the left and right buttons for the keeper descriptions, the site should select the next available keeper "tile" and then display the keeper's graphic on the platform, as well as the keeper's detail (See Assets/Details.pdf). In addition, when the user clicks on a keeper's tile in the listing, that keeper's data should be displayed.

5. In addition, feel free to add additional css animations to show off your skills.

Please implement the solution and return to us by Monday Morning at 12pm EST.

Thank you!
